

ABSTRACT

An integrated light and accessory assembly for a vehicle is disclosed. The assembly includes at least one lamp for illumination of a vehicle, and also includes reflective, conductive and insulative portions inside a housing, and a module for controlling or accessorizing the assembly. Also disclosed is a method of manufacturing the assembly. The method includes providing materials for molding or shaping the components of the assembly, selectively etching conductive materials, molding the materials into a desired configuration, connecting a lamp and an accessory module to the conductive portions, and enclosing the components in a housing. A portion of the module may be removed for emergency lighting.
